## Is Flipping Theory Discovered or Invented?

Flipping Theory stands at the boundary between what is found in the universe and what is created by the human mind. Its key elements—photon aging, the Incipient Law of Creation, the Gaussian energy distribution, and flip-pons—feel like natural laws waiting to be recognized. They point to structures that may have existed long before we named them.

Yet the language, concepts, and connections that form the theory are unmistakably inventive. The choice to reinterpret redshift, to describe creation as a continuous flow, and to link cosmic energy to sigma intervals required imagination, not just observation.

Thus Flipping Theory is both discovered and invented. It discovers hidden patterns in the universe, and it invents the conceptual tools needed to reveal them. Like all meaningful theories, it is a meeting point: the universe provides the structure, and the theorist provides the form.

In essence, Flipping Theory is an act of recognition—half revelation, half creation.
